ZEROWATERLOSS

Chapter 12 – TELL has a vision!

The longer TELL is active in Switzerland, the more the power of the HYDRANTS impresses him. He can't let go of the idea of building the best HYDRANT in the ZEROWATERLOSS universe. He gets down to work in his workshop. For the casting he only uses recycled and recyclable materials and relies on Swiss foundries. The cover should be able to be opened easily and safely in every situation. It has to be a FLAP. Here he also wants to install sensor technology, firstly the ORTOMAT technology with autocorrelation function for leak detection and network monitoring and secondly the alarm sensor which bears his name. It regularly happens that HYDRANTS are operated incorrectly. This should not result in any damage. TELL invents the STOPR non-return valve and reduces the risk of water hammers with its patented ANIWAH closing geometry by up to 50%. HYDRANTS must be vented – the HBE universal valve is perfect for this purpose. Consideration must also be given to installation in the field: His HYDRANT should be 360°-adjustable and the riser pipe should have the largest adjustment range from 110 - 180 cm. The VONROLL CLASSIC emerges and for fans of lightweight construction the VONROLL HYTEC, which only weighs 22 kg and accommodates the TELL alarm sensor in the STÖRZ. TELL is raffling off an overnight stay for 2 people in the Très Grand Hotel Victoria Jungfrau in Interlaken (with one of the world's best breakfast buffets and a unique Harder view from the spa) among all individuals who can correctly match his innovations by 28.2.2022 on www.vonroll-hydro.world/wettbewerb. Relaxation in dramatic times!
